

rPrintStars1

Write a **recursive** function that will read an array of numbers and print lines of asterisks that correspond to the numbers in reverse order. For example, if the size is 3 and the array data is {4, 6, 1}, then the output should be:

```
*
*****
****
```

The prototype of the function is given as follows:

```
void rPrintStars1(int ar[20], int size);
```

A sample program template is given below for testing the function:

```
#include <stdio.h>
void rPrintStars1(int ar[20], int size);
int main()
{
    int ar[20], size, i;

    printf("Enter size: \n");
    scanf("%d", &size);
    printf("Enter array data: \n");
    for (i=0; i<size; i++)
        scanf("%d", &ar[i]);
    printf("The output is: \n");
    rPrintStars1(ar, size);
    return 0;
}
void rPrintStars1(int ar[20], int size)
{
    /* Write your code here */
}
```

Some sample input and output sessions are given below:

(1) Test Case 1

Enter size:

1

Enter array data:

4

The output is:

(2) Test Case 2

Enter size:

3

Enter array data:

```
4 6 1
The output is:
*
*****
****
```

(3) Test Case 3

```
Enter size:
6
Enter array data:
4 6 1 9 3 6
The output is:
*****
***
*****
*
*****
****
```
