

rStrReverse2

The **recursive** function that accepts a character string *str* and its string size as parameters, and returns the the string in reverse order. For example, if *str* is "abcde", then the function will return "edcba" via the pointer parameter. The function prototype is given as follows:

```
void rStrReverse2(char *str, int n);
```

A sample program template is given below to test the function:

```
#include <stdio.h>
#include <string.h>
void rStrReverse2(char *str, int n);
int main()
{
    char str[40], *p;

    printf("Enter a string: \n");
    fgets(str, 40, stdin);
    if (p=strchr(str, '\n'))
        *p = '\0';
    rStrReverse2(str, strlen(str));
    printf("rStrReverse2(): %s", str);
    return 0;
}
void rStrReverse2(char *str, int n)
{
    /* Write your code here */
}
```

Some sample input and output sessions are given below:

(1) Test Case 1:

```
Enter a string:
abcde
rStrReverse2(): edcba
```

(2) Test Case 2:

```
Enter a string:
abcd
rStrReverse2(): dcba
```

(3) Test Case 3:

```
Enter a string:
a
rStrReverse2(): a
```
