

rPattern2

Write a **recursive** C function that prints a pattern with a specified height (between 1 and 9). For example, rPattern2 (5) will print the pattern below:

```
*****
****
***
**
*
```

The prototype of the function is given as follows:

```
void rPattern2(int height);
```

A sample program template is given below for testing the function:

```
#include <stdio.h>
void rPattern2(int height);
int main()
{
    int height;

    printf("Enter the height: \n");
    scanf("%d", &height);
    printf("The pattern is: \n");
    rPattern2(height);
    return 0;
}
void rPattern2(int height)
{
    /* Write your code here */
}
```

Some sample input and output sessions are given below:

(1) Test Case 1

```
Enter the height:
2
The pattern is:
**
*
```

(2) Test Case 2

```
Enter the height:
7
The pattern is:
*****
*****
*****
****
```

* * *
* *
*
